

2.

Method	What does the method do?
banana	multiplies kiwi w/ the each element in the array
grapefruit	If the element in the array is equal to grape, then return i, which is the position in which grape is found. If grape is not found, -1 is returned.
pineapple	It is searching for how many times apple elements are found in the pine array, then it is counting how many occurrences occurred.

Variable	Role it plays
kiwi	Initializing and storing a value that can be returned later
i	Iterate through the array
grape	The value being searched
apple	Parameter that you are looking for
pine	value that is being searched
pear	counting
